

# EmotiFace: Real Time Facial Emotion Detection System

---

## 1. Project Overview (What's the Idea?)

This project focuses on building a real-time facial emotion detection system using computer vision and deep learning. It captures video input via a webcam, detects faces, and classifies the expressed emotion using a Convolutional Neural Network (CNN). This model can serve as an “emotion detection module” for future big projects mentioned under Future Features heading below.

Optional Feature:

If time permits, an optional enhancement can also be integrated into the project. The system will also log detected emotions over time, enabling emotion trend analysis to study behavioral or emotional changes throughout usage periods.

Future Features:

The recognized emotion can potentially be used to trigger personalized conversational responses in future versions by integrating with large language models such as ChatGPT or embedded within assistive robots capable of emotion-aware interactions. **However, the scope of this project is strictly limited to the development and implementation of the emotion detection and logging components using computer vision.** The chatbot and robot integration is envisioned for future work and will not be part of this implementation.

## Key Features

- Real-time webcam feed integration
- Facial emotion classification using a trained CNN
- Optional : Emotion logging for time-based trend analysis (e.g., emotional fluctuations throughout the day/week)

## 2. Future Insights and Advancement in Medical Area:

- Chatbot Integration: Incorporating emotion-aware language models like ChatGPT to provide responsive, empathetic interactions based on detected emotions.
- Support for Dementia Patients: Integrating emotion recognition with conversational AI to help dementia patients receive context-sensitive companionship and support, improving emotional well-being.
- Emotion Trend Visualization: Using logged data to build insights such as mood timelines or behavior patterns for use in medical or therapeutic contexts.

### 3. Rationale & Market Relevance

Emotional awareness in technology is vital, especially in healthcare, education, and support systems. In future implementations, this emotion detection module can be integrated into conversational robots or AI companions in hospital or caregiving environments— by detecting a person's emotion in real time, this system can help in mental health support, especially for patients with dementia or depression.

Additionally, emotion trend tracking can help caregivers, therapists, or users themselves recognize patterns of mood shifts, emotional volatility, or potential mental health issues early.

#### Why this project?

- Demonstrates real-world use of computer vision and deep learning
- Foundational system for future intelligent empathetic agents
- Can be integrated in conversational robotic systems Useful in assistive medical applications (e.g., eldercare, therapy)
- Tracks and stores emotional states over time to assist in behavioral analytics

#### Existing Solutions:

- Commercial APIs (Azure, Affectiva, Face++) require paid usage or cloud dependency.

#### Value Added:

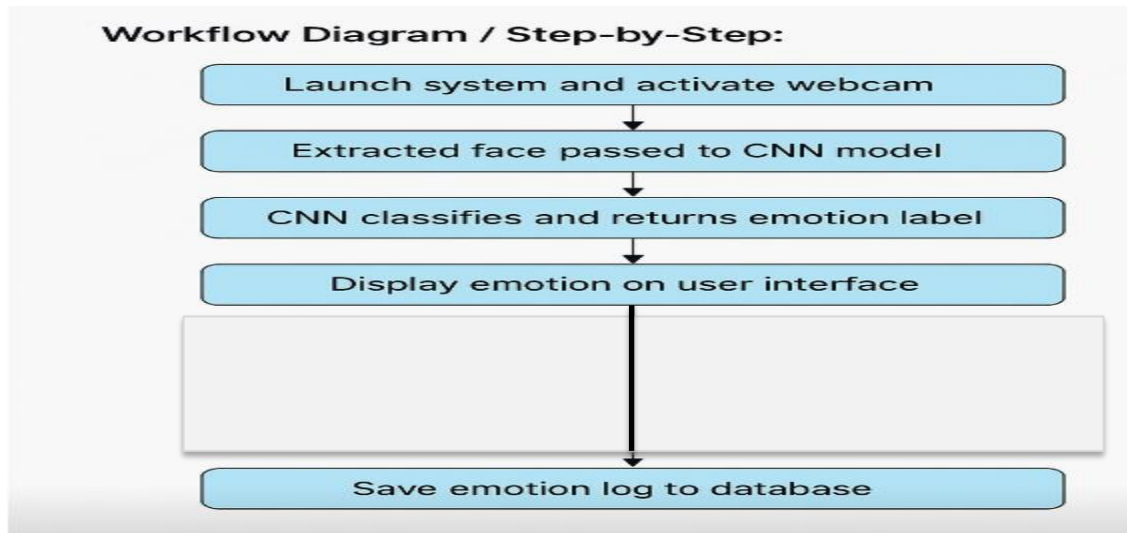

- Local, open-source, and customizable solution
- Emotion data storage for future analysis and insights
- Can be integrated into larger empathetic systems later

### 4. Workflow & Methodology

#### Approach:

- Dataset: FER2013 or AffectNet
- Model: CNN to classify 7 emotions (Happy, Sad, Angry, Surprised, Neutral, Disgusted, Fearful)
- Preprocessing: Face detection via OpenCV, image normalization and resizing
- Tools: Python, TensorFlow/Keras, OpenCV, Flask (for optional UI)

## Workflow Steps:

## ERD:
